

# Gas Detector PCE-FGD Series

## PCE-FGD Series

Gases and gas mixtures have become indispensable in industry and research. The PCE-FGD series gas detectors are particularly suitable for monitoring the industrial gases required in many industries. Processes such as combustion may produce harmful toxic gases which should be monitored to protect people. The gas detectors of the PCE-FGD series are also particularly suitable for monitoring the gases generated during digestion processes such as in sewer shafts or silos. The risk of carbon dioxide poisoning as it is used in the beverage industry or for the better flourishing of fruit and vegetables in greenhouses can be significantly reduced with these gas detectors. For example the fact that nitrogen displaces atmospheric oxygen, can be counteracted with the gas detectors.

The already integrated standard signal output 4 ... 20 mA / 2 ... 10 V ensures easy connection of the gas detectors to existing process systems. The required operating voltage of 16 ... 19 V DC is already provided in many systems. By connecting the gas detector to a control panel or PLC, visual and acoustic alarms can be triggered if the limit values are exceeded or underrun.

For example the IP65 protected housing of the gas detectors of the PCE-FGD series enables installation in humid sewer shafts for monitoring hydrogen sulfide, for example, as well as in carbon dioxide stores which are often found in dispensing systems. The mounting holes already provided in the robust ABS housing allow for mounting directly on a wall. Optional mounting brackets or a mounting plate can also be purchased for easier assembly of the gas detectors.
